October 16, 1956
Sampling Methods

Seining on the other hand was less reliable than either visual checks or electrosampling except at Station \#2 (lower) on Maacama Creek where stickle backs not observed by other means were found.

In regard to species composition there were wide diversions due in part to qualitative differences already mentioned. Although there was excellent agreement at Station \#1 (middle) on Big Sulphur Creek, except for species of minor importance, differences ran as high as 56.7 percent ( 78.3 minus 21.6 ), as can be seen by the table:

## TABLE I

A Comparison of Three Methods of Fish Population Sampling At Four Stations on Two Streams Tributary to the Russian. River, 1956

## Percentage Composition by Species

| Stations | RT-SH | Sucker | Squawfish | Roach | Stickleback |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Big Sulphur Creek |  |  |  |  |  |
| Station No. 1 |  |  |  |  |  |
| Electro-sampling (Aug.) | 94.2 | 5.8 | 0 | 0 | 0 |
| Seining (Oct.) | 99.3 | 0.7 | 0 | 0 | 0 |
| Visual Observation (Oct.) | 95.0 | 4.1 | 0.7 | 0.2 | 0 |
| Station No. 2 |  |  |  |  |  |
| Electro-sampling (Aug.) | 4.6 | 31.3 | 17.5 | 46.6 | 0 |
| Seining (Oct.) | 1.7 | 4.3 | 76.1 | 17.9 | 0 |
| Visual Observation (Oct.) | 0.7 | 7.2 | 59.5 | 32.6 | 0 |
| Maacama Creek |  |  |  |  |  |
| Station Ho. 1 |  |  |  |  | [(Sculpin - 0.8\% ] |
| Electro-sampling (Aug.) | 78.3 | 0 | 0 | 20.9 | 0 |
| Seining (Oct.) | 0 | 0 | 0 | $\begin{aligned} & \text { (No. }=1 \text { ) } \\ & 100.0 \end{aligned}$ | 0 |
| Visual Observation (Oct.) | 21.6 | 17.2 | 0 | 61.2 | 0 |
| Station No. 2 |  |  |  |  |  |
| Electro-sampling (Aug.) | 15.8 | 0 | 3.2 | 75.9 | $\begin{array}{lll} {[(\text { Gr. Sunfish }} & - & ] \\ {[(\text { T. Perch }} & - & ] \\ {[(\text { Sculpin }} & - & ] \end{array}$ |
| Seining (Oct.) | 20.2 | 5.0 | 0 | 51.6 | 23.2 |
| Visual Observation (Oct.) | 34.1 | 4.7 | 0 | 61.2 | 0 |

It was felt that differences among observers performing the visual checks also had some bearing on this subject. Table 2 shows differences both as to the numbers of fish of the various species observed and the resulting percentages. Discounting the probable differences in the upstream and downstream areas of each station, the two observers disagreed in their findings as much as $91.2 \%$. The lack of agreement existed even though the observers alternated between upstream and downstream sections from station to station in order to overcome this possible source of difference. Qualitatively, however there was excellent agreement except in the case of roach.

TABLE II
Results of Fish Population Sampling by Visual Observation at Four Stations on Two Streams Tributary to the Russian River, Oct. 16, 1956

## Species

|  | RT-SH | Sucker | Squawfish | Roach |  |
